Letter of Recommendation

In 2019, PT Geopetro Daya Nusa and Sofoil LLC had conducted an analysis of downhole pressure and production data of 4 oil producing wells in Pematang Lantih (PLT) Field located in Tungkal Block, Jambi province.

The Multiwell Retrospective Test (MRT) analysis was performed in one of the key well which has longest production history. The interpretation demonstrated the interwell interaction and connectivity as well as estimation of several reservoir parameters, such as transmissibility, permeability thickness, skin and drainage area. Furthermore, the recommendation to performed pressure maintenance was made in order to ease production decline.

MOTL team believes that the result of the interpretation that has been performed was aligned with other method that was applied internally. Hence, this MRT analysis is practical and could be applied well in the presence of good and complete data set.

Overall, this is a good and practical application to get understanding of the interwell interference, field subsurface uncertainties as well as optimizing future field development plan.

Best Regards,

Jeris R. Cherdasa
